

Clear - User Persona & Context

Origin Story

Clear was born from a personal need: getting back into working out after years of group fitness classes. The problem wasn't motivation - it was **decision fatigue and planning friction**.

Group fitness provided:

-  Zero planning required
-  Guaranteed good workout
-  Movement variety and discovery
-  Show up and execute

Clear recreates this experience for solo gym-goers.

Primary Use Case

The Scenario

User is walking out of the locker room, water bottle in one hand, phone in the other. They:

1. Launch Clear
2. Set intensity (slider), mood (optional text), anchor (tap button)
3. Hit Generate
4. **Workout is ready by the time they reach the weights** (30 seconds max)

Context Details

- **When:** Immediately before workout (not planned the night before)
 - **Where:** In the gym (building gym, variable equipment)
 - **Device:** Phone (mobile-first, possibly one-handed)
 - **Duration:** 2-3 minutes from open → start workout
 - **Environment:** Variable (affects equipment availability, not UI brightness)
-

Primary Persona

"The Efficient Athlete" (You)

Demographics:

- Previously active (group fitness background)
- Has access to gym (building amenity)
- Wants to train consistently
- Values efficiency over complexity

Problems Solved:

- **Decision fatigue:** "What should I do today?"
- **Stagnation:** Repeating the same online workouts
- **Planning friction:** Don't want to research/design workouts
- **Movement discovery:** Wants exposure to exercises they wouldn't pick themselves

Desired Outcome:

- Focus on **training**, not planning
 - Trust the AI to deliver variety and balance
 - Minimal cognitive load pre-workout
-

Secondary Persona (Future)

"Everyone" - The Whole Spectrum

Clear benefits all fitness levels:

- **Beginners:** Removes intimidation of not knowing what to do
- **Intermediate:** Adds variety to prevent plateaus
- **Advanced:** Provides structured rotation without micromanagement
- **Injured/Limited:** Can adapt via anchor selection and notes

Teaching via Osmosis: Users discover new movements naturally, just like in group fitness classes.

Key Behaviors

Frequency

- **Potentially daily**, definitely **before every workout**
- Not a "plan ahead" tool - it's a **just-in-time generator**

Editing Workouts

- **Fast follow feature** (not MVP, but critical)
- Users need to **swap movements** quickly for:
 - Equipment conflicts (rack is taken)
 - Injury/limitation (shoulder hurts today)
 - Preference (hate burpees)

MVP: Review screen allows basic edits (change exercise names, sets/ reps) **Future:** Quick swap suggestions, equipment filters

Trust Level

- Users start skeptical but build trust over time
- Early adopters will edit more, experienced users will trust and execute
- Historical data helps validate AI is rotating intelligently

Mobile-First Design Implications

Screen 1 & 2: Input + Review (Long Scroll)

- **Touch targets:** 48px minimum (thumb-friendly)
- **Minimal typing:** Sliders, buttons, presets over text fields
- **Quick taps:** Most interactions are single tap (intensity, anchor)
- **Optional fields collapsible:** Don't clutter the critical path

Screen 3: Workout Execution (Paginated)

- **One section at a time:** Reduce cognitive load during sets
- **Large, clear text:** Reading while breathing hard
- **Swipe or big button to advance:** No precision taps between sets
- **Timers always visible:** Section + overall

General Principles

- **One-handed friendly where possible** (holding water bottle)
 - **Minimize scrolling during workout** (pagination in execution)
 - **Fast input:** Default to presets, sliders, buttons
 - **Forgiving touch targets:** Sweaty hands, distracted environment
-

Success Metrics (Implicit)

Speed

- **30 seconds:** Locker room → workout ready
- **3 taps minimum:** Intensity, anchor, generate

Trust

- Users stop editing after 5-10 sessions
- Return rate increases (becomes a habit)

Discovery

- Users try movements they've never done
 - Rotation feels balanced over time
-

Key Insights for Design

1. **Friction is the enemy:** Every extra tap/scroll is a reason to skip the gym

2. **Defaults matter:** Most users won't customize much (tired, pre-workout)
3. **Mobile context:** One hand, distracted, ready to move
4. **Just-in-time mindset:** Not planning, executing now
5. **Trust is earned:** Early screens need to feel smart and intentional
