

Clear — MVP Specification (LLM Reference)

This document is a **machine-readable, scope-locked MVP specification** for the Clear web application.

It is intended to be used as: - a persistent reference inside an LLM-assisted coding project (e.g., Claude) - a grounding document to prevent scope drift - a source of truth for requirements, behavior, and constraints

If a feature or behavior is **not explicitly defined here**, it is **out of scope for MVP**.

PRODUCT SUMMARY

Product name: **Clear**

Product type: Local-first web application

Core function: Generate, review, and execute daily hybrid strength workouts with minimal input while maintaining intelligent rotation and historical continuity.

Clear is a **decision and execution system**, not a fitness tracker or social app.

PRIMARY USER GOAL

Allow a user to: 1. Configure how today's workout should be generated 2. Review and optionally edit the generated workout 3. Execute the workout step-by-step in a focused "Workout Mode" 4. Capture lightweight notes during execution 5. Save the session so future workouts can rotate intelligently and recall prior context

SUPPORTED INPUTS (GENERATION)

Required Inputs

- intensity: integer (1–10)
- mood: string (free text)
- anchor: enum
- squat
- hinge
- press
- pull
- rotation
- surprise

Optional Inputs

- time: integer (minutes)
- notes: string (free text)

Implicit Inputs

- active_location_id (selected location preset)
 - rotation_state (derived from saved history)
-

ONBOARDING REQUIREMENTS

On first run, the application must: - Require onboarding completion - Prompt the user to create 1–3 location presets

Each location preset includes: - id - name (string) - available_equipment (array of strings) - notes (optional string)

No accounts, authentication, or cloud sync are included in MVP.

WORKOUT GENERATION BEHAVIOR

Workout generation must follow **MASTER PROMPT v2 — Hybrid Strength System** exactly.

Structural Constraints

- Total duration target: 35–45 minutes
- Required sections, in order:
 - Warm-Up
 - Primary Lift
 - Accessory Block
 - Rotational / Stance
 - Conditioning
 - Cooldown

Rotation Rules (Mandatory)

- Prevent consecutive repeats of the same anchor
- Maintain balanced frequency across anchors
- If anchor == surprise:
 - Select the least-recent logical anchor based on history

Rotation logic must reference **saved session history**, not transient UI state.

Intensity Scaling

- intensity 1–3: mobility, tempo, breath emphasis
 - intensity 4–6: sustainable strength, control, stability
 - intensity 7–10: compound emphasis, reduced accessory volume, power/endurance finish
-

OUTPUT CONTRACT (GENERATION)

Each generated workout must include the following fields:

- title: string
- coach_overview: string
- program_sheet: structured content with:
 - sections
 - exercises per section
 - sets, reps, tempo, rest, short note per exercise
 - total_time_estimate: integer (minutes)

The generation output must be deterministic in structure (no layout variance).

REVIEW & EDIT PHASE (PRE-WORKOUT)

After generation and before execution: - The user must be able to review the full workout - The user must be able to edit: - exercise names - sets/reps/load text - notes

If historical data exists for a movement: - Surface last-used load and notes as reference

No automatic progression logic is included in MVP.

WORKOUT MODE (EXECUTION)

Workout Mode begins only after explicit user action: .

Behavior

- Generation inputs are locked
- The workout is presented one section at a time
- User advances manually via

Per-Section Features

- List of movements
- Per-movement note fields (e.g., load used)

- Section-level notes field

Timing

- Overall workout timer
- Per-section timer (auto-start on section entry)

Workout Mode captures data but does not analyze it in MVP.

PERSISTENCE & HISTORY

Required Persistence

- Location presets
- Generated workouts
- Edited workouts
- Execution notes
- Rotation metadata (last anchors, timestamps)

Storage

- Local-only (IndexedDB preferred)
- Device-specific

History View

- List of saved sessions
- Each entry displays:
 - date
 - title
 - anchor
 - intensity
 - location

CORE USER ACTIONS

- generate_workout
 - review_edit_workout
 - start_workout
 - advance_section
 - add_notes
 - save_session
 - randomize_again
-

EXPORT / IMPORT

Export

- User can export all local data as a JSON file

Import

- User can import a previously exported JSON file
 - Import replaces local data
-

EXPLICIT NON-GOALS (OUT OF SCOPE)

The following must not be implemented in MVP: - User accounts or authentication - Cloud sync - Wearable or native fitness app integration - Exercise ratings or scoring - Analytics dashboards - Performance tracking or progression logic - Notifications or reminders - Social features

MVP DEFINITION (CANONICAL)

Clear MVP is complete when a user can generate, review, execute, and save daily workouts with intelligent rotation and historical continuity using only local data, minimal input, and a calm, predictable interface.

IMPLEMENTATION RULE

If a proposed change: - increases cognitive load during generation or execution - introduces identity or account complexity - adds interpretation or analytics instead of capture

...it is **not MVP** and must be deferred.
