

# Clear - Claude Code Handoff

**Created:** December 22, 2025

**Purpose:** Everything Claude Code needs to build the remaining screens

---

## Project Overview

Clear is a fitness app that generates personalized workouts using AI. The core workout flow (Generation → Review → Workout Mode) is already built in Lovable. Now we need to add supporting screens to complete the app.

### Tech Stack:

- React (functional components, hooks)
  - Tailwind CSS (custom config with Clear design tokens)
  - TypeScript (if Lovable used it)
  - Local storage for data persistence
- 

## What Already Exists

The following screens are built and working:

- **Screen 1: Generation Input** — User sets intensity, anchor, generates workout
- **Screen 2: Review & Edit** — User reviews generated workout, can edit exercises
- **Screen 3: Workout Mode** — User executes workout section by section

The design system is also complete:

- Color tokens (purple, indigo, orange, rose, lime, neutral)
  - Typography (Rajdhani, Inter, Oxanium)
  - Component styles (buttons, inputs, cards, glassmorphic effects)
  - Cyberpunk utilitarian aesthetic
-

# What Needs to Be Built

## Priority Order

1. **Home/Dashboard** — New entry point for returning users
  2. **Onboarding (5 steps)** — First-time user setup flow
  3. **Summary Screen** — Post-workout completion
  4. **Workout History + Session Detail** — Past workout reference
  5. **Settings** — Preference management
- 

## Screen Specifications

### 1. Home/Dashboard

**File:** `Clear_-_Screen_0__Home_Dashboard__Wireframe_.md`

**Purpose:** Landing screen for returning users

#### Key Elements:

- Hero CTA: "Generate Workout" → navigates to Screen 1
- Quick Start: Auto-suggested intensity + anchor based on history → skips to Screen 3
- Streak tracker: Day count, week view (M-S boxes), "Mark Rest Day" button
- Recent workouts: Last 3 sessions, tap to view detail
- Hamburger menu → Settings

#### Logic:

- Quick Start intensity: Based on previous day's workout (recovery logic)
  - Quick Start anchor: Auto-rotates to avoid recent repeats
  - Rest day: 3+ consecutive rest days triggers "injury/sick" prompt
  - If no workout history: Quick Start shows "Start your first workout"
- 

### 2. Onboarding (5 Steps)

**File:** Clear\_-\_Onboarding\_\_Wireframe\_.md

**Purpose:** First-time user setup (< 3 minutes)

### **Step 1: Equipment/Location**

- Select tier: Minimal / Home Gym / Building Gym / Full Gym
- Tier populates equipment checklist (accordion, closed by default)
- User can toggle equipment on/off
- Becomes default location

### **Step 2: Experience Level**

- Select one: New to this / Some experience / Confident
- Affects exercise complexity and cue verbosity
- Does NOT lock users out of intensity levels

### **Step 3: Goals & Structure**

- Select preset: Strength / Balanced / Conditioning / Quick & Effective
- Preset populates section toggles (accordion, closed by default)
- User can toggle sections on/off
- "What do these mean?" expands legend with descriptions
- **Important:** If Primary Lift is OFF, anchor options change (see Anchor Logic below)

### **Step 4: Limitations**

- Free text textarea
- Optional (can skip)
- LLM parses later during workout generation

### **Step 5: Confirmation**

- Summary of all selections
- [Edit] links back to specific steps
- "Generate First Workout" → saves preferences, goes to Screen 1

## Data to Store:

```
javascript

{
  location: {
    name: "Building Gym",
    equipment: ["barbell", "dumbbells", "rack", "cables", "bench"]
  },
  experienceLevel: "confident", // "new" | "some" | "confident"
  goal: "balanced", // "strength" | "balanced" | "conditioning" | "quick"
  sections: ["warmup", "mobility", "primary", "accessory", "core", "conditioning", "cooldown"],
  limitations: "Bad left shoulder, overhead pressing feels sketchy"
}
```

---

## 3. Summary Screen

**File:** (Clear\_-\_Summary\_Screen\_\_Wireframe\_.md)

**Purpose:** Post-workout completion, mood capture, streak update

### Key Elements:

- Celebration: 🎉 "NICE WORK!"
- Workout summary: Anchor, intensity, duration, section count
- Mood tracker: 5 emojis (😞 😐 😊 😄 😁), tap to select
- Session notes: Optional textarea
- Streak update: "12 → 13 days 🔥" with week view
- "FINISH" button: Auto-saves everything, returns to Home

**Triggers:** User taps "Finish" on last section of Workout Mode

---

## 4. Workout History + Session Detail

**File:** (Clear\_-\_Workout\_History\_\_Wireframe\_.md)

**Purpose:** View past workouts, reference weights/notes

## History List:

- Search bar (disabled for MVP — future natural language)
- Filter chips: All / Anchor (dropdown) / Intensity (dropdown)
- Grouped by month
- Each card: Date, anchor, intensity, duration
- Tap card → Session Detail
- "Load More" pagination

## Session Detail:

- Date as title
  - Summary: Anchor, intensity, duration, goal preset, mood
  - Each section with exercises, sets/reps, logged weights
  - User notes (📝) inline where captured
  - Session notes at bottom
  - Read-only (no editing past workouts)
- 

## 5. Settings

**File:** `Clear_-_Settings__Wireframe_.md`

**Purpose:** Manage preferences (reuses onboarding UI patterns)

### Settings Hub:

- Locations / Equipment → sub-screen
- Experience Level → sub-screen
- Workout Structure → sub-screen
- Limitations → sub-screen
- Send Feedback → email/form
- About Clear → version info

**Sub-screens:** Mirror onboarding steps 1-4, with Save button instead of Next

## Locations sub-screen additions:

- List of saved locations with radio for default
  - [🖱️] edit button per location
  - "+ Add Location" button
  - Edit screen includes "Delete Location" option
- 

## Content Definitions

**File:** `Clear_-_Content_Definitions.md`

## Equipment by Tier

**Minimal:** Bodyweight (always on), Resistance Bands, Mat, Foam Roller

**Home Gym:** + Dumbbells, Kettlebells, Bench (flat), Pull-up Bar, TRX, Treadmill

**Building Gym:** + Barbell, Squat Rack, Cable Machine, Adjustable Bench, Lat Pulldown, Rowing Machine

**Full Gym:** + Leg Press, Smith Machine, Hack Squat, Chest Press Machine, Shoulder Press Machine, Leg Curl/Extension, Pec Deck, Assisted Pull-up/Dip, Battle Ropes, Assault Bike, Stair Climber

## Workout Sections (10 total)

| Section             | Description                                          |
|---------------------|------------------------------------------------------|
| Warm-up             | Light movement to get your body ready                |
| Mobility            | Focused flexibility and range of motion work         |
| Primary Lift        | The main heavy movement — squats, deadlifts, presses |
| Accessory           | Supporting work for the primary lift                 |
| Skill / Power       | Explosive movements — jumps, throws, Olympic lifts   |
| Carries             | Loaded carries — farmer's walks, suitcase carry      |
| Core                | Rotational and stability work for your midsection    |
| Stability / Balance | Single-leg work, proprioception focus                |

| Section      | Description                                     |
|--------------|-------------------------------------------------|
| Conditioning | Cardio, circuits, or higher-intensity finishers |
| Cooldown     | Stretching and recovery to end the session      |

### Anchor Logic

#### If Primary Lift IS selected:

- Anchor options: SQUAT, HINGE, PRESS, PULL, ROTATION, SURPRISE

#### If Primary Lift is NOT selected:

- Anchor options: UPPER BODY, LOWER BODY, FULL BODY
- Accessory section also hidden/disabled

This affects the Generation Screen (Screen 1) anchor grid.

### Goal Presets

**Strength:** Warm-up, Mobility, Primary Lift, Accessory, Core, Cooldown

**Balanced:** Warm-up, Mobility, Primary Lift, Accessory, Core, Conditioning, Cooldown

**Conditioning:** Warm-up, Mobility, Carries, Core, Stability/Balance, Conditioning, Cooldown (no Primary Lift)

**Quick & Effective:** Warm-up, Primary Lift, Core, Cooldown (4 sections only)

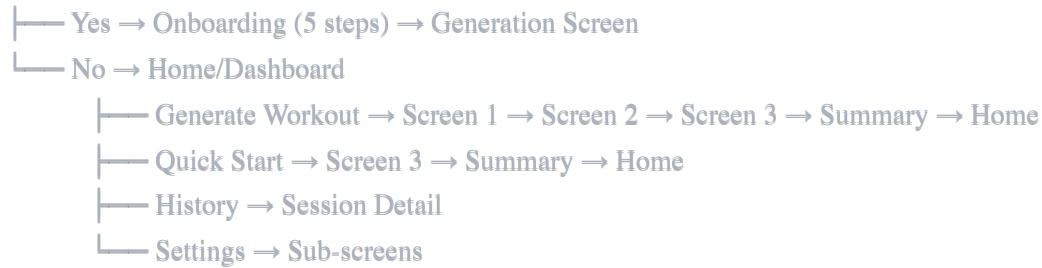

### Navigation Flow

**File:** clear-navigation-flow.mermaid

App Open

[First time?]

## State Management Requirements

### User Preferences (persist across sessions)

javascript

```
{
  locations: [{name, equipment}],
  defaultLocationId: string,
  experienceLevel: string,
  goal: string,
  sections: string[],
  limitations: string,
  onboardingComplete: boolean
}
```

### Workout History (persist across sessions)

javascript

```
{
  workouts: [{
    id: string,
    date: Date,
    anchor: string,
    intensity: number,
    duration: number,
    goal: string,
    sections: [{
      name: string,
      exercises: [{
        name: string,
        sets: string,
        reps: string,
        weight: string,
        notes: string
      }]
    }],
    sessionNotes: string,
    mood: number // 1-5
  }]
}
```

### Streak Data (persist across sessions)

javascript

```
{
  currentStreak: number,
  lastWorkoutDate: Date,
  restDays: Date[], // dates marked as rest
  weekView: { [date]: "workout" | "rest" | null }
}
```

### Current Session (in memory, saved on Finish)

javascript

```
{
  startTime: Date,
  anchor: string,
  intensity: number,
  sections: [...],
  exerciseNotes: { [exerciseId]: string },
  sectionNotes: { [sectionId]: string },
  mood: number,
  sessionNotes: string
}
```

## Design System Reference

### Colors

javascript

```
purple: '#9966CC' // Primary brand
indigo: '#4F479A' // Secondary
orange: '#F17B14' // Accent, CTAs
rose: '#B62F57' // High intensity
lime: '#8DE937' // Low intensity, success
neutral: {
  50: '#FFFEFB', // Off-white (text)
  900: '#161313' // Near-black (background)
}
```

### Typography

- **Display/Headers:** Rajdhani (500, 600, 700) — uppercase, wide tracking
- **Body:** Inter (400, 500, 600)
- **Technical/Data:** Oxanium (400) — monospace, uppercase labels

### Component Patterns

- **Primary CTA:** Orange gradient, glowing border
- **Ghost/Secondary:** Transparent bg, outline border
- **Cards:** Glassmorphic (backdrop blur, semi-transparent bg, subtle border)

- **Inputs:** Dark transparent bg, colored left accent stripe
- **Accordions:** Closed by default, chevron indicator

## Aesthetic

- Cyberpunk utilitarian
  - Dark background (  #161313 )
  - Soft glows and blur effects
  - Sharp corners (0 border radius)
  - Grain texture overlay (subtle)
- 

## Build Checklist

### Phase 1: Home/Dashboard

- ☐ Create Home component
- ☐ Implement Hero CTA (link to Generation)
- ☐ Implement Quick Start (auto-suggest logic, skip to Workout Mode)
- ☐ Implement Streak tracker (visual only for now)
- ☐ Implement Recent workouts list
- ☐ Add hamburger menu → Settings
- ☐ Update routing (Home as default for returning users)

### Phase 2: Onboarding

- ☐ Create Onboarding wrapper with step state
- ☐ Step 1: Equipment/Location
- ☐ Step 2: Experience Level
- ☐ Step 3: Goals & Structure (with accordion + legend)
- ☐ Step 4: Limitations
- ☐ Step 5: Confirmation
- ☐ Save preferences to local storage
- ☐ Update routing (Onboarding for first-time users)

### Phase 3: Summary

- ☐ Create Summary component

- ☐ Implement mood tracker (5 emoji buttons)
- ☐ Implement session notes textarea
- ☐ Implement streak update display
- ☐ Connect Finish button (save data, return to Home)
- ☐ Update Workout Mode to navigate to Summary on completion

#### **Phase 4: History**

- ☐ Create History list component
- ☐ Implement filter dropdowns (Anchor, Intensity)
- ☐ Implement month grouping
- ☐ Create Session Detail component
- ☐ Connect to stored workout data
- ☐ Add navigation from Home

#### **Phase 5: Settings**

- ☐ Create Settings hub
- ☐ Create Locations sub-screen (list, edit, add, delete)
- ☐ Create Experience Level sub-screen
- ☐ Create Workout Structure sub-screen
- ☐ Create Limitations sub-screen
- ☐ Connect to stored preferences
- ☐ Add navigation from hamburger menu

#### **Phase 6: Integration**

- ☐ Wire up onboarding-complete flag
- ☐ Wire up Quick Start logic (recent workout analysis)
- ☐ Wire up streak calculation
- ☐ Wire up anchor logic (Primary Lift on/off)
- ☐ Test full user flows
- ☐ Polish and bug fixes

---

#### **Files to Reference**

All wireframes and specs are in the Documents folder:

- `Clear_-_Screen_0__Home_Dashboard__Wireframe_.md`

- `Clear_-_Onboarding__Wireframe_.md`
- `Clear_-_Summary_Screen__Wireframe_.md`
- `Clear_-_Workout_History__Wireframe_.md`
- `Clear_-_Settings__Wireframe_.md`
- `Clear_-_Content_Definitions.md`
- `Clear_-_User_Personas.md`
- `Clear_-_User_Journey_Maps.md`
- `clear-navigation-flow.mermaid`
- `clear-sitemap.mermaid`

Existing code is in the code folder (Lovable export).

---

## Notes for Claude Code

1. **Match existing patterns.** Look at how Lovable structured Screen 1-3 and follow the same conventions.
  2. **Reuse components.** Many UI elements repeat (accordions, toggle chips, cards). Extract reusable components.
  3. **Onboarding + Settings share UI.** Build onboarding steps as reusable components that Settings can import.
  4. **Local storage first.** No backend for MVP. All data persists in localStorage or IndexedDB.
  5. **Mobile-first.** All layouts should work on 375px width. Touch targets minimum 48px.
  6. **Don't break existing screens.** The core workout flow (Screen 1-3) should continue to work as-is.
-
