

Clear - User Journey Maps

Created: December 20, 2025

Status: Draft (Session 1B)

Primary Persona: Alex (Lazy Planner)

Overview

Three journey maps covering the core user experiences:

- 1. **Onboarding** — First-time setup
- 2. **Typical Session** — Returning user generates and executes workout
- 3. **Edge Cases** — Equipment conflicts, injury mods, history review

Journey 1: Onboarding (First-Time User)

Goal: Get user from download → first workout in under 3 minutes

Principle: Collect only what makes workouts better. No fluff.

Flow

Step 1: Equipment / Location

Screen Purpose: Know what exercises are possible

User Actions:

1. Select equipment tier:
 - **Minimal** — Bodyweight, bands, maybe a mat
 - **Home Gym** — Dumbbells, bench, basic equipment
 - **Building Gym** — Squat rack, barbells, cables, dumbbells
 - **Full Gym** — Commercial gym, all equipment available
2. Tier auto-populates equipment checklist
3. User can **add or remove** items:
 - Toggle items on/off
 - Structured selection (not free text)
 - Common equipment options provided
4. This becomes their default location

Copy/Messaging:

- "You can add more locations later"
- "Select what you have access to"

Persona Notes:

- Alex: Selects "Building Gym," maybe removes cable machine if not available
 - Jordan: Might select "Home Gym" or "Minimal" — less intimidating
 - Sam: Selects whatever's at their gym, moves fast through this
-

Step 2: Experience Level

Screen Purpose: Adjust exercise complexity and cue verbosity

User Actions:

1. Select one:

- **New to this** — Still learning, want guidance
- **Some experience** — Know the basics
- **Confident** — Just tell me what to do

What This Affects (Under the Hood):

- Exercise selection (goblet squat vs. barbell back squat)
- Coaching cue detail level
- Default intensity suggestion (beginners might default to 5, confident to 7)

What This Does NOT Do:

- Does not lock users out of any intensity level
- Does not require tutorials or external links
- Does not gatekeep movements

Persona Notes:

- Alex: "Confident" — minimal cues, trust the output
 - Jordan: "New to this" — wants more guidance, will read cues
 - Sam: "Confident" — knows what they're doing, just needs structure
-

Step 3: Goals → Workout Structure

Screen Purpose: Customize what a workout includes

User Actions:

1. **First:** Select a preset goal:
 - **Strength** — Heavy lifts, longer rest, less cardio
 - **Balanced** — Mix of everything (default 6 sections)
 - **Conditioning** — Circuits, supersets, shorter rest
 - **Quick & Effective** — Fewer sections, time-optimized
2. **Then:** Customize sections (required to show, optional to change):
 - Preset maps to recommended sections

- User sees which sections are included
- Can toggle sections on/off
- Can reorder sections (future consideration)

Default Sections (Balanced):

- ✓ Warm-up
- ✓ Primary Lift
- ✓ Accessory Work
- ✓ Rotational / Core
- ✓ Conditioning
- ✓ Cooldown

Section Behavior:

- Warm-up and Cooldown default ON
- User can toggle any section off
- Minimum: At least one section required

Copy/Messaging:

- "You can change this anytime"
- "Pick what fits your goals"

Persona Notes:

- Alex: Balanced, keeps all 6 sections
 - Jordan: Might pick Balanced, fewer sections feels less overwhelming
 - Sam: Quick & Effective, maybe 3-4 sections max
-

Step 4: Limitations (Optional)

Screen Purpose: Avoid movements that cause pain or problems

User Actions:

1. Free text input field
2. Or skip ("Nothing right now")

Example Inputs:

- "Bad left shoulder, overhead pressing feels sketchy"
- "Knee surgery 2 years ago, careful with deep squats"
- "Lower back issues"

How It Works:

- Text passed to workout generation as context
- LLM parses and avoids problematic movements
- Can be updated anytime in settings

Copy/Messaging:

- "Anything we should keep in mind?"
- "Any injuries or limitations to work around?"
- (No "AI coach" language)

Persona Notes:

- Alex: Might add shoulder note, or skip
- Jordan: Might mention something, appreciates being asked
- Sam: Skips unless relevant — no time to waste

Step 5: Confirmation

Screen Purpose: Review before starting

Display:

- Equipment/Location summary
- Experience level

- Workout structure (sections enabled)
- Limitations (if any)

User Actions:

- "Looks good" → Proceed to Generate (Screen 1)
- "Edit" → Go back to specific step

Copy/Messaging:

- "Here's your setup"
 - "Ready to generate your first workout?"
-

Journey 2: Typical Session (Returning User)

Goal: Workout ready in 30 seconds

Context: Alex is walking out of locker room, phone in hand

Flow

Save Session

→ Return to Home / Generation Screen

Key Moments

Opening the App:

- MVP: Opens directly to Generation Screen (Screen 1)
- Future: Home/Dashboard with recent workouts + Generate CTA

Generation (Screen 1):

- Intensity slider (1-10) — primary input
- Anchor selection (6 buttons) — what's the focus?
- Location preset (if multiple locations set up)
- Optional: Time estimate, notes for today
- **30 seconds max** to hit Generate

Review (Screen 2):

- Scan workout title and overview
- Expand sections to see exercises
- Vibe check: "Does this feel right?"
- If yes → Start Workout
- If no → Edit exercise or Randomize Section

Execution (Screen 3):

- One section at a time (paginated)
- See exercises, sets, reps
- Add notes as you go (weight used, how it felt)
- Tap Next to advance sections
- Timer tracks section and overall time

Completion:

- Summary shows workout + notes
- Save Session stores data locally
- Return to start for next time

Intensity & Sections Interaction

Intensity	Workout Character	Likely Sections
1-2	Movement day. Mobility, stretching, light activity. "I showed up."	Warm-up, Mobility/Stretch, Cooldown
3-4	Easy day. Light resistance, nothing taxing.	Warm-up, Light Accessory, Cooldown
5-6	Moderate. Solid workout, sustainable effort.	All 6 sections, moderate loads
7-8	Hard. Challenging lifts, real effort.	All 6 sections, heavier loads, longer rest
9-10	All out. Heavy, intense, leave it on the floor.	All 6 sections, peak effort

Logic:

- Intensity shapes *how hard* sections are (load, reps, rest)
- User's section preferences shape *what's included*
- Some combos don't make sense — UI/AI can suggest adjustments but user decides
- Warm-up and Cooldown should always be encouraged (but can be skipped)

Journey 3: Edge Cases

Edge Case A: Equipment Conflict

Scenario: Alex is doing a Pull day. Workout includes Barbell Bent-Over Row. The squat rack is taken.

Current Flow (Screen 2 or 3):

1. See exercise that requires unavailable equipment
2. Tap exercise name → Edit modal
3. Change to alternative (e.g., "DB Bent-Over Row")
4. Or: Tap "Randomize Section" to get new suggestions

Future Enhancement:

- "Quick Swap" suggestions (AI offers 2-3 alternatives)
- Equipment conflict detection based on location profile

Persona Notes:

- Alex: Knows alternatives, will edit quickly
 - Jordan: Might not know what to swap — needs suggestions
 - Sam: Needs instant swap, no friction
-

Edge Case B: Injury / Modification Mid-Workout

Scenario: Jordan is doing workout, shoulder starts hurting on overhead press.

Current Flow (Screen 3):

1. In workout execution, tap exercise
2. Add note: "Shoulder hurt, skipped" or "Did lateral raises instead"
3. Continue workout
4. (Limitation not saved permanently — just this session)

Future Enhancement:

- "Flag this exercise" → Adds to limitations in settings
- Regression suggestion appears automatically

Persona Notes:

- Alex: Modifies on the fly, knows what to do
 - Jordan: Might feel stuck — needs guidance or permission to skip
 - Sam: Swaps fast, moves on
-

Edge Case C: Checking History

Scenario: Alex wants to see what weight they used last time for Deadlift.

Current Flow (MVP):

- Historical data shown on Screen 2: "Last: 185-225lbs"
- Range based on past sessions with that movement

Future Flow:

- History screen with past workouts
- Tap workout → See full details with notes
- Search by exercise name

Persona Notes:

- Alex: Glances at range, adjusts based on feel
 - Jordan: Might not have history yet — sees "No history" gracefully
 - Sam: Quick check, moves on
-

Edge Case D: Changing Settings Post-Onboarding

Scenario: Sam joins a new gym with more equipment.

Flow:

1. Go to Settings (from menu)
2. Locations section
3. Add new location with equipment checklist
4. Set as default (or select per-workout)

What's Editable in Settings:

- Locations / Equipment
- Experience level
- Default workout structure (sections)
- Limitations

- (Future: Account, sync, export)

Friction Points Identified

Moment	Friction	Mitigation
Onboarding equipment setup	Could be tedious	Tier presets auto-populate; edit only what's wrong
Choosing workout structure	Overwhelming options	Preset goals first, customize optional but visible
Exercise unfamiliar (Jordan)	Doesn't know movement	Coaching cues visible; regression prominent
Equipment conflict	Flow disruption	Easy edit access; future: quick swap suggestions
Workout runs long (Sam)	Trust broken	Accurate time estimates; respect time input
AI suggests same exercises	Boredom, trust erosion	Rotation logic uses history; randomize section option

Open Questions (For Future Sessions)

1. **Home/Dashboard screen:** What does returning user see first? Generate CTA + recent workouts?
2. **Multiple locations:** How does user switch between them on Screen 1? Dropdown? Accordion?
3. **Section reordering:** Can users change section order, or just toggle on/off?
4. **Workout templates:** Should users be able to save a workout structure as a personal template?
5. **Progress/streaks:** Any habit reinforcement UI? Or keep it purely functional?

Next Steps

Phase 2: Screen Definition & Wireframing

- Onboarding screens (Steps 1-5)
- Home/Dashboard screen
- Settings screen

- History screen

Journey maps validated: December 20, 2025
